

Oriahnn

What is Oriahnn?

An oral medication specifically developed to reduce heavy periods in premenopausal women with uterine fibroids.

Oriahnn lightens periods quickly. Women in the ORIAHNN trials experienced 50% less period bleeding by Month 1.*

About 7 in 10 women taking Oriahnn had lighter periods at the final month of treatment compared with about 1 in 10 women taking placebo. This meant bleeding volume was reduced by at least 50% from the start of the trial, and to below 80 mL (about 1/3 of a cup) at the final month of treatment.

*For Trial 1, average decrease in period bleeding at Month 1 was 52% with Oriahnn and 13% with placebo. For Trial 2, average decrease in period bleeding at Month 1 was 51% with Oriahnn and 6% with placebo.

How Oriahnn Works

Oriahnn was specifically developed to reduce heavy periods in premenopausal women with fibroids. It works by reducing estrogen and progesterone, which is one way to help lighten period bleeding.

How Oriahnn Works Differently Than Birth Control

Unlike birth control pills, Oriahnn was specifically made to reduce heavy periods due to fibroids. Oriahnn does not prevent pregnancy. You will need to use effective methods of birth control while taking Oriahnn and for 28 days after you stop taking it.†

Do not take Oriahnn if you are or think you may be pregnant, and stop taking Oriahnn if you become pregnant. It can alter your period, making it difficult to know if you are pregnant, so watch for other signs of pregnancy.

*Talk to your doctor about which birth control to use. Ask about effective birth control that does not contain hormones. Your doctor may change your birth control before you start taking Oriahnn.
